

NR503-60513 Week 4 Midterm Quiz (20 questions) 30 minutes

Chapter 1

1. What does "OECD" stand for?

Organization, economic, cooperation, development

2. The Commonwealth Fund's Biennial Health Insurance Survey assesses the extent and quality of coverage for U.S. working-age

adults

3. In 2018, adults aged 18 to 64 in states with a(n) federal marketplace were more likely to be uninsured than those in states with a state-based marketplace or states with a hybrid marketplace.

4. The reader learns how to identify population parameters, the potential impact of a population-based approach to care, and the importance of designing nursing interventions at the population level in advanced nursing practice.

5. What does "ANA" stand for?

American Nurses Association

6. For 20 years, the American Nurses Association (ANA) has been advocating for healthcare reforms that would guarantee access to high-quality healthcare for all.

7. As with any potential threat to health, education of our youth and 9adult populations regarding the deleterious effects of hookahs is paramount to reducing the potential morbidity and mortality of long-term exposure to these flavored tobaccos.

8. During the same time period, no change was found in the use of other tobacco products (including cigarettes) (CDC, 2019d).

9. The same answer also completes the following sentence: The tobacco and smoke from hookahs have toxic properties and have been linked to various cancers, including lung and oral cancers.

10. The implementation of standard or proven (evidence-based) strategies to prevent illness and/or improve the health of targeted groups of people can have the effect of ameliorating health problems at the population and/or aggregate level.

11. Building on earlier studies that linked smoking in adulthood with ACEs, Brown et al. (2010) discovered a relationship between a history of ACEs and the risk of dying from lung cancer.

12. More and more studies are being conducted to look at the relationship of sustained exposure to toxic stress to a variety of poor health outcomes and high-risk behaviors.

13. The same answer also completes the following sentence: Many additional studies have been conducted that demonstrate the destructive effects of exposure to toxic stress.

14. The APRN needs to take into consideration the many facets of health and disease, genetics and environment, including human attitudes, attributes, and behavior when determining how to implement a population-based intervention.

15. The same answer also completes the following sentence: Several factors, such as the physical environment, healthcare systems, personal behaviors, and the social environment, can have a deleterious impact on individual and community health.

16. Outcomes measurement in population-based care begins with the identification of the population and the problem, followed by the generation of a clinical question related to outcomes.
