- **Question 1**

A 66-year-old woman has experienced a significant decline in her quality of life as a result of worsening rheumatoid arthritis. Her physician has prescribed etanercept and the APRN is responsible for facilitating this new aspect of the patient's drug regimen. This will involve the administration of

Selected Answer: weekly subcutaneous injections.

- **Question 2**

A 20-year-old woman will soon begin taking oral contraceptives for the first time. What advice should the nurse provide to this patient?

Selected Answer: "Make sure to seek care quickly if you experience bad headaches, calf pain, or changes in vision."

- **Question 3**

A Nurse Practitioner is providing patient education to a 50-year-old woman who is taking methotrexate (MTX) for breast cancer. The nurse will instruct the patient to avoid which of the following drugs?

Selected Answer: Salicylates

- **Question 4**

A 3-year-old boy has developed otitis media and requires antibiotics. In order to increase the chance that the boy will take his prescribed medication, the nurse should

Selected Answer: offer a choice between liquid and chewable medications, if possible.
