

Chief Complaint

post op visit

History of Present Illness

Patient is a 52 yo G1P0010 with a hx of enlarged left ovary on recent MRI, concerning for possible malignancy. Patient reports symptoms of abdominal bloating with associated symptoms of early satiety. Patient states that for the last month she has been experiencing abdominal bloating, patient thought that maybe she had a hernia. The initial work up included an MRI which demonstrated a 17 x 14 x 10 cm, described as cystic with multiple septations with both solid and cystic components. They also noted multiple uterine fibroids largest being 5.1 x 5.1 cm involving the uterine fundus. [1]

Treatment Summary

04/15/21: MRI of pelvis demonstrating a left ovarian mass measuring 17 x 14 x 10 cm described as having both cystic and solid components with multiple septations. There are also multiple uterine fibroids, largest measuring 5.1 cm involving the uterine fundus, likely subserosal.

04/23/2021: Initial appointment with Dr. Hoffman

04/28/2021: Exploratory laparotomy. Left salpingo-oophorectomy with frozen section. Total abdominal hysterectomy with right salpingectomy. Stage IA endometrial adenocarcinoma, endometrioid type, FIGO grade 1

Interval History

Patient reports discomfort under her right rib cage with onset in the evening. Patient reports difficulty with deep inhales and feels short of breath at times. Patient reports she attempts to perform deep breathing exercises at home but is uncertain if she is performing this correctly. She reports experiencing blurry vision at least once a week post op. She reports this occurs first thing in the morning and it normally resolves spontaneously after a few minutes. She denies other vision concerns and reports an eye exam about 4 weeks prior to surgery. She reports doing well otherwise. She reports her pain has been minimal. She denies fever, chills, chest pain, abnormal vaginal discharge or bleeding.
