

1. Dr. Kline's IRB requires him to obtain written informed consent. Which of the following does Dr. Kline NOT need

A description of the study's hypotheses

2. Which of the following is a disadvantage of using open-ended questions?

The answers must be coded.

2. Dr. Kline is planning on conducting a study next semester. He is curious as to whether sleep deprivation is associated with poorer cognitive performance. For example, if you sleep poorly the night before a big exam, will you do worse? Dr. Kline is especially curious about selective sleep deprivation, where people are kept from entering REM (rapid eye movement) sleep. Using an electroencephalograph (EEG) to monitor brain waves, he plans to let participants sleep until they enter REM sleep and then he will wake them. After the participants are awake for one minute, Dr. Kline plans to let them return to sleep. As they enter REM sleep again, he will wake them again and follow the same procedure. He plans to do this through the entire eight- hour sleep session. The following morning, participants will be asked to take a sample SAT test.

OK

3. Imagine that Dr. Kline is a clinical psychologist who volunteers his time at a local prison counseling several inmates. participants. Why is this choice potentially problematic?
